# I. Package Options

## INTRODUCTION

This document provides a detailed explanation of the options available in the `adddoc` package. Each option is described with its possible values and effects on document formatting and behavior.

### 1. AVAILABLE OPTIONS

#### A. *aktif*

- **Values:** `true` (default), `false`
- **Effect:** Enables the `attach` toggle when set to `true` or left empty, controlling whether the table of appendices is printed. Stores the value in `\activ`.

#### B. *pathappendix*

- **Values:** Any valid file path string
- **Effect:** Defines the path for appendix files, stored in `\appath`, used to locate and include appendix files.

#### C. *code*

- **Values:** `true`, `false`, or empty
- **Effect:** Enables the `code` toggle when set to `true` or left empty, allowing the inclusion of code listings using the `listings` package.

**D.     *logo***

- **Values:** Any valid file path string
- **Effect:** Specifies the path to a logo file for appendix headers, stored in `\appathlogo`. If no logo is provided, the default omits the logo from the header.

**E.     *language***

- **Values:**
  - `fr`: French
  - `de`: German
  - `en`: English
- **Effect:** Sets the document's language, affecting the table of appendices' names, such as *Table des Annexes* (French), *Anhangsverzeichnis* (German), and *Table of Appendices* (English). Stored in `\doclanguage`.

**F.     *fancyfooter***

- **Values:** Any string
- **Effect:** Sets the footer text for appendix pages, stored in `\fancyfooter`.

**G.     *algo***

- **Values:** `true`, `false`, or empty
- **Effect:** Enables the `algo` toggle when set to `true` or left empty, allowing the inclusion of algorithms using the `algorithm2e` package.

## 2. DEFAULT VALUES AND SETTINGS

- **Logo Path:** `no` (no logo provided)
- **Appendix Path:** `{ }`
- **Language:** `fr` (French)
- **Fancy Footer:** `{ }`

## II. Functionality of Toggled Options

### 1. APPENDICES MANAGEMENT

When `actif` is set to `true`, appendices management is enabled using the `titletoc` package. This includes defining and customizing counters for chapters and appendices, and generating a table of appendices in the selected language.

### 2. CODE LISTINGS

If `code` is enabled, the `listings` package is configured for code snippets with custom settings for different programming languages and UTF-8 support.

- `\lstlisting`: Standard command for code listings.
- `\lstcolor{color}{text}`: Changes text color in code listings.

### 3. ALGORITHMS

Enabling `algo` configures the `algorithm2e` package for algorithms, customizing the list of algorithms title and setting up keywords and formatting for algorithm blocks.

## 4. PDF INCLUSION

The package provides commands for including PDF files in appendices, with options for landscape or portrait orientation, scaling, and offsets. The `pathappendix` and `logo` options determine file location and display settings.

## III. Appendix Commands

### 1. APPENDIX STRUCTURE IN L<sup>A</sup>T<sub>E</sub>X

The `adddoc` package extends L<sup>A</sup>T<sub>E</sub>X's basic appendix functionality by introducing:

- Custom appendix counters
- A dedicated list of appendices (`\listofappendixs`)
- Commands to add appendices and center images within them

### 2. COMMANDS OVERVIEW

- `\attachment{label}{title}`: Adds an appendix entry with the specified title and label.
- `\achapter{title}`: Starts a new appendix chapter.
- `\asection{label}{title}`: Creates a new appendix section under a chapter.
- `\lspapp{label}{title}{content}`: Creates an appendix section in landscape mode.
- `\centeredimg{width}{filepath}`: Centers an image within an appendix section.

### *PDF Inclusion*

Different ways to embed a PDF document in the appendix

- `\pdf[landscape mode]{ref}{title}{filename.pdf}`: simple command, `size = 0.8\textwidth`
- `\pdfsize[landscape mode]{scaling}{ref}{title}{filename.pdf}`: Allows for explicit size control.
- `\pdfoptions[options]{filename}`: A more flexible command that allows detailed customization when embedding PDF files.  
`\pdfoptions[scale=0.9, offseth=-1cm, landscape=true, title={My`

- `scale`: Specifies the scale of the PDF (default: 0.8).
- `offseth`: Sets the vertical offset (default: -2cm).
- `offsetw`: Sets the horizontal offset (default: 0cm).
- `landscape`: Indicates whether the PDF should be displayed in landscape mode (values: `true` or `false`, default: `false`).
- `title`: Specifies the title of the PDF section in the appendix.
- `ref`: Defines a reference label for the PDF section.

This command allows you to embed a PDF document with customized scaling, offset, and orientation. It also supports the addition of a title and reference label for easy identification in the document.

### 3. CUSTOMIZING APPENDICES

#### A. *Counters*

`adddoc` defines custom counters for clear and consistent numbering:

- `achapter`: Appendix chapter level (A, B, C, etc.)
- `appendix`: Individual appendices within chapters (1, 2, 3, etc.)

#### B. *List of Appendices*

The list of appendices is customized using the `titletoc` package:

- `\l@achapter[2]{...}`: Defines appendix chapter appearance in the TOC.
- `\l@appendix{\@dottedtocline{1}{2.5em}{2.3em}}`: Formats individual appendix entries.

## 4. EXAMPLE USAGE

```
\listofappendixs % Generates the list of appendices
\appendix % Start the appendix section
\begin{achapter}{Technical Appendices}
  \asection{specs}{Technical Specifications}
  % Content here...
  \asection{data}{Data Tables}
  \centeredimg{0.9}{images/data_table.png}
  % Content here...
  \lspapp{landscapeApp}{Wide Table}{
    \begin{tabular}{...}
      % Large table content
    \end{tabular}
  }
\end{achapter}
```

**Algorithm 1:** General calibration algorithm**Data:**  $n$  samples**Initialisation**

Create a voltage sequence of  $n$  samples  
 Create the queues and the shared memory  
 Start the camera and image processing  
 Pause the image acquisition

**Main program**

**for**  $i = 1$  **to**  $n$  **do**  
     Move the mirror according to the voltage sequence  
     Start image acquisition and wait until finished  
      $P_i \leftarrow Q_i$     Read the coordinates from FIFO queue    **\*/**

**End sequence**

Close the processes, queues and shared memory  
 Do something with the points  $P_i$   
 Write the result into a JSON file

```
\renewcommand{\tcc}[1]{\texttt{\* \hspace{0.5cm} #1 \hspace{0.5cm} */}}
\SetAlgoNlRelativeSize{-2}
\begin{algorithm}
  \caption{General calibration algorithm}
  \label{alg:calibration}
  \DontPrintSemicolon
  \KwData{$n$ samples}
  \init{
    Create a voltage sequence of $n$ samples\;
    Create the queues and the shared memory\;
    Start the camera and image processing\;
    Pause the image acquisition \;
  }
  \main{\For{$i=1$ \KwTo $n$}{
    Move the mirror according to the voltage sequence\;
    Start image acquisition and wait until finished\;
    $P_i$ \gets $Q_i$ \tcc{Read the coordinates from FIFO queue}\;
  }}
  \endpro{
    Close the processes, queues and shared memory\;
    Do something with the points $P_i$\;
    Write the result into a JSON file\;
  }
\end{algorithm}
```

## 5. **DEPENDENCIES**

- `titletoc`: Customizes TOC entries.
- `pdfscape`, `pdfpages`: Manage landscape orientation and PDF embedding.
- `etoolbox`, `ifthen`, `xkeyval`: Handle package options and conditional logic.
